

High-spec battery charging from GYS

Battery support equipment manufacturer GYS has said that the rapid development of commercial vehicle battery technology has brought a new set of challenges for operators.

"Many larger vehicles are now being fitted with AGM/EFB, Silver/Calcium, Lead Acid and Gel batteries, workshops and commercial vehicle operators need to consider what battery chargers they are using to avoid costly mistakes," the company said.

GYS offers the Batium range of chargers, which is designed to meet the demand for charging these new high specification batteries. Micro-processor-controlled, the Batium range is claimed to take away the risk from the garage and operator. With no pre-selection

required, it is not necessary to identify the battery type (which is not always easy); and even if connected incorrectly, no harm can be caused to either the battery or the vehicle.

With a multistage charging curve, the Batium is designed to charge all current battery types to a high level without risk to the battery. At the same time, the advanced electronics will ensure total safety for charging batteries whilst in the vehicle, and the entire Batium range is safe to use unattended, GYS says. Designed and manufactured by GYS in France, the range has models suitable for 6V/12V/24V batteries, and to charge all sizes of battery up to a 350Ah.
